Exercise 7: Query Optimisation and First-Order Query Expressivity

Database Theory

2022-05-24

Maximilian Marx, Markus Krötzsch

Exercise 1

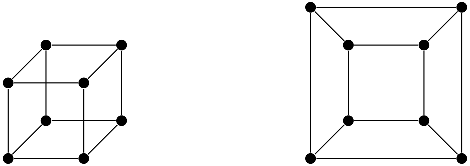
Exercise. For the following pairs of structures, find the maximal r such that $\mathcal{I} \sim_r \mathcal{J}$:

(i)

(ii)

(iii)

(iv)



Exercise 1

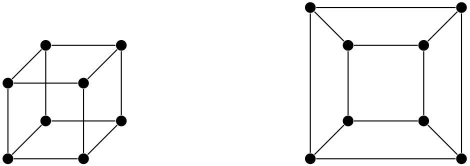
Exercise. For the following pairs of structures, find the maximal *r* such that $\mathcal{I} \sim_r \mathcal{J}$:

(i)

(ii)

(iii)

(iv)



Solution.

Exercise 1

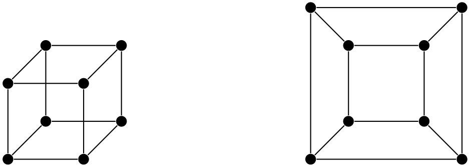
Exercise. For the following pairs of structures, find the maximal r such that $\mathcal{I} \sim_r \mathcal{J}$:

(i)

(ii)

(iii)

(iv)



Solution.

(i) $r \leq 1$,

Exercise 1

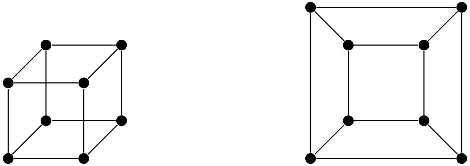
Exercise. For the following pairs of structures, find the maximal r such that $\mathcal{I} \sim_r \mathcal{J}$:

(i)

(ii)

(iii)

(iv)



Solution.

(i) $r \leq 1$,

(ii) $r \leq 2$,

Exercise 1

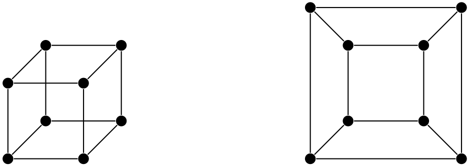
Exercise. For the following pairs of structures, find the maximal r such that $\mathcal{I} \sim_r \mathcal{J}$:

(i)

(ii)

(iii)

(iv)



Solution.

(i) $r \leq 1$,

(ii) $r \leq 2$,

(iii) $r = 0$, and

Exercise 1

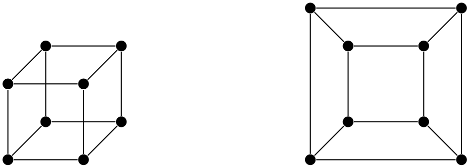
Exercise. For the following pairs of structures, find the maximal r such that $\mathcal{I} \sim_r \mathcal{J}$:

(i)

(ii)

(iii)

(iv)



Solution.

(i) $r \leq 1$,

(ii) $r \leq 2$,

(iii) $r = 0$, and

(iv) $r \geq 0$.

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \qquad \text{and} \qquad \mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$$

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \qquad \text{and} \qquad \mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$$

1. For which r are $\mathcal{L}_6 \sim_r \mathcal{L}_7$, i.e., for which $r \geq 0$ does the Duplicator win the r-round EF game on $\mathcal{L}_6$ and $\mathcal{L}_7$?

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6$ and $\mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$

1. For which r are $\mathcal{L}_6 \sim_r \mathcal{L}_7$, i.e., for which $r \geq 0$ does the Duplicator win the r-round EF game on $\mathcal{L}_6$ and $\mathcal{L}_7$?
2. More generally, for which r are $\mathcal{L}_n \sim_r \mathcal{L}_{n+1}$?

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \qquad \text{and} \qquad \mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$$

1. For which r are $\mathcal{L}_6 \sim_r \mathcal{L}_7$, i.e., for which $r \geq 0$ does the Duplicator win the r-round EF game on $\mathcal{L}_6$ and $\mathcal{L}_7$?
2. More generally, for which r are $\mathcal{L}_n \sim_r \mathcal{L}_{n+1}$?

Theorem (11.10; Lecture 11, Slide 24)

The following are equivalent:

- $\mathcal{L}_m \sim_r \mathcal{L}_n$, *and*
- *either (1)* $m = n$, *or (2)* $m \geq 2^r - 1$ *and* $n \geq 2^r - 1$.

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \qquad \text{and} \qquad \mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$$

1. For which r are $\mathcal{L}_6 \sim_r \mathcal{L}_7$, i.e., for which $r \geq 0$ does the Duplicator win the r-round EF game on $\mathcal{L}_6$ and $\mathcal{L}_7$?
2. More generally, for which r are $\mathcal{L}_n \sim_r \mathcal{L}_{n+1}$?

Theorem (11.10; Lecture 11, Slide 24)

The following are equivalent:

- $\mathcal{L}_m \sim_r \mathcal{L}_n$*, and*
- *either (1)* $m = n$*, or (2)* $m \geq 2^r - 1$ *and* $n \geq 2^r - 1$*.*

Solution.

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6$ and $\mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$

1. For which r are $\mathcal{L}_6 \sim_r \mathcal{L}_7$, i.e., for which $r \geq 0$ does the Duplicator win the r-round EF game on $\mathcal{L}_6$ and $\mathcal{L}_7$?
2. More generally, for which r are $\mathcal{L}_n \sim_r \mathcal{L}_{n+1}$?

Theorem (11.10; Lecture 11, Slide 24)

The following are equivalent:

- $\mathcal{L}_m \sim_r \mathcal{L}_n$, *and*
- *either (1)* $m = n$, *or (2)* $m \geq 2^r - 1$ *and* $n \geq 2^r - 1$.

Solution.

1. $r \leq 2$.

Exercise 2

Exercise. A *linear order* is a relational structure with one binary relational symbol $\leq$ that is interpreted as a reflexive, asymmetric, transitive and total relation over the domain. Up to renaming of domain elements there is exactly one linear order for every finite domain, which can be depicted as a chain of elements. We denote the linear order of size n by $\mathcal{L}_n$. For example:

$\mathcal{L}_6 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6$ and $\mathcal{L}_7 : 1 \leq 2 \leq 3 \leq 4 \leq 5 \leq 6 \leq 7$

1. For which r are $\mathcal{L}_6 \sim_r \mathcal{L}_7$, i.e., for which $r \geq 0$ does the Duplicator win the r-round EF game on $\mathcal{L}_6$ and $\mathcal{L}_7$?
2. More generally, for which r are $\mathcal{L}_n \sim_r \mathcal{L}_{n+1}$?

Theorem (11.10; Lecture 11, Slide 24)

The following are equivalent:

- $\mathcal{L}_m \sim_r \mathcal{L}_n$*, and*
- *either (1)* $m = n$*, or (2)* $m \geq 2^r - 1$ *and* $n \geq 2^r - 1$*.*

Solution.

1. $r \leq 2$.
2. $n \geq 2^r - 1 \implies r \leq \lfloor \log_2(n+1) \rfloor$.

Exercise 3

Exercise. A graph is *planar* if it can be drawn on the plane without intersections of edges. For example, the following graph A is planar, while graph B is not:

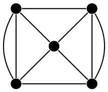


Figure: A

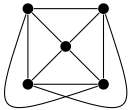

Figure: B

1. Can the graphs A and B be distinguished by a FO query?
2. Show that planarity is not FO-definable by using locality.

Exercise 3

Exercise. A graph is *planar* if it can be drawn on the plane without intersections of edges. For example, the following graph A is planar, while graph B is not:

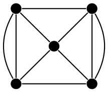

Figure: A

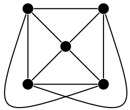

Figure: B

1. Can the graphs A and B be distinguished by a FO query?
2. Show that planarity is not FO-definable by using locality.

Solution.

Exercise 3

Exercise. A graph is *planar* if it can be drawn on the plane without intersections of edges. For example, the following graph A is planar, while graph B is not:

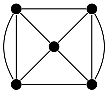

Figure: A

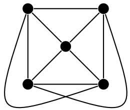

Figure: B

1. Can the graphs A and B be distinguished by a FO query?
2. Show that planarity is not FO-definable by using locality.

Solution.

1. This query matches B but not A:

$$\exists x, y, z, w, v.\ \mathrm{E}(x, y) \wedge \mathrm{E}(y, z) \wedge \mathrm{E}(z, w) \wedge \mathrm{E}(w, x) \wedge \mathrm{E}(x, v) \wedge \mathrm{E}(y, v) \wedge \mathrm{E}(z, v) \wedge \mathrm{E}(w, v) \wedge \mathrm{E}(x, z) \wedge \mathrm{E}(y, w)$$

Exercise 3

Exercise. A graph is *planar* if it can be drawn on the plane without intersections of edges. For example, the following graph A is planar, while graph B is not:

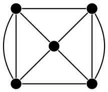

Figure: A

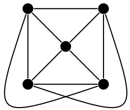

Figure: B

1. Can the graphs A and B be distinguished by a FO query?
2. Show that planarity is not FO-definable by using locality.

Solution.

1. This query matches B but not A:

$$\exists x, y, z, w, v.\ \mathrm{E}(x, y) \wedge \mathrm{E}(y, z) \wedge \mathrm{E}(z, w) \wedge \mathrm{E}(w, x) \wedge \mathrm{E}(x, v) \wedge \mathrm{E}(y, v) \wedge \mathrm{E}(z, v) \wedge \mathrm{E}(w, v) \wedge \mathrm{E}(x, z) \wedge \mathrm{E}(y, w)$$

2. For φ with quantifier rank r, consider counterexamples of size $d = 3^r$:
